

Start by laying out the walls. Don't pry the individual pieces loose just yet. There are a lot of parts that are easily confused

Pry loose the bottom layer of each wall. Try to keep the walls from falling apart. If the pieces get mixed up, the build is going to be much more difficult and confusing.

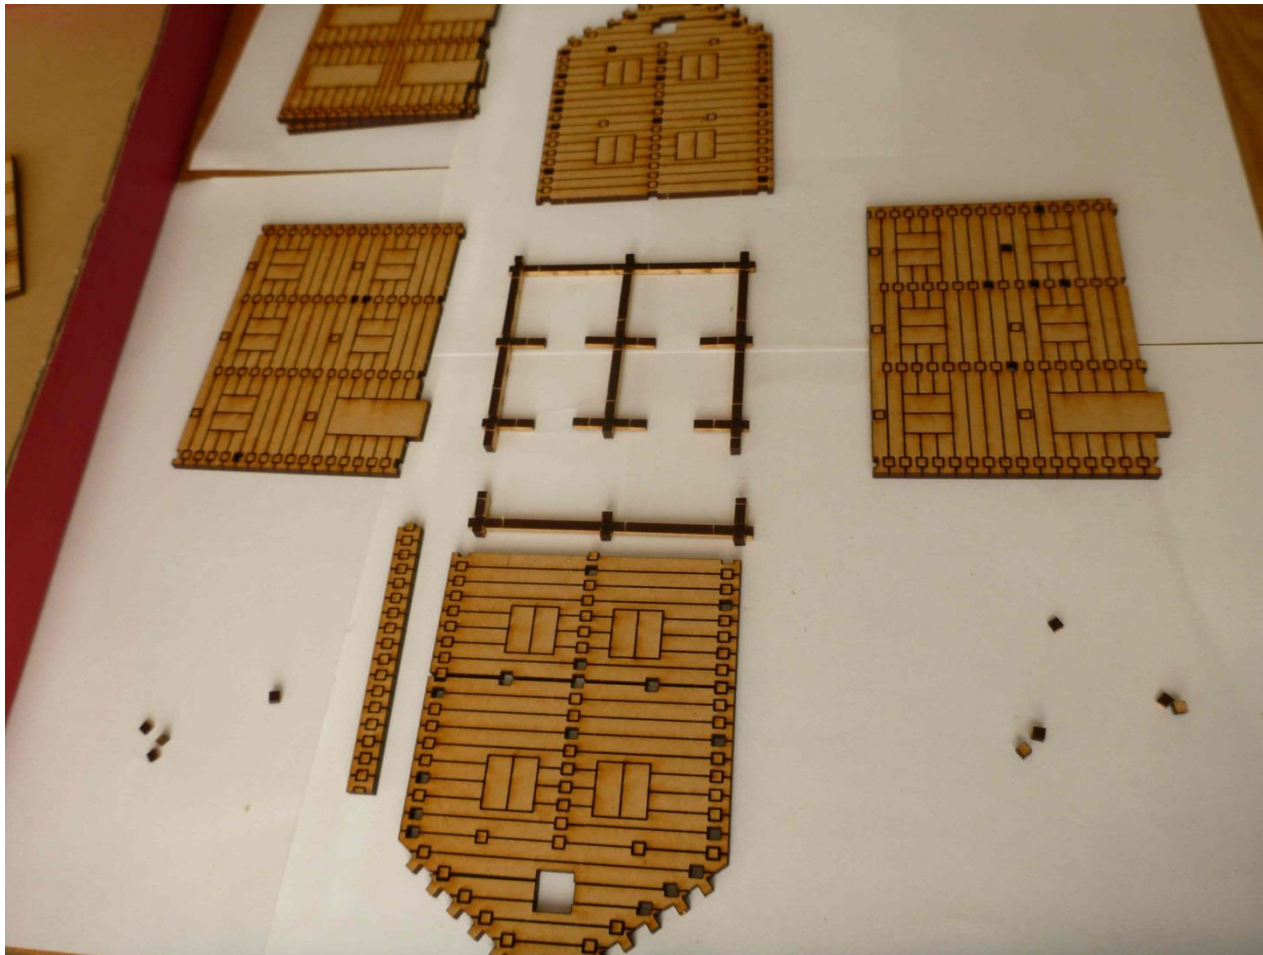

Start from the bottom, build upwards layer by layer. Pry loose the layers from the bottom of the walls as you need them. Use glue, otherwise things are going to fall apart at some point. The corners around the doors and windows are especially vulnerable points. I placed the two doors adjacent in this example. Placing them diagonally makes for a sturdier building.

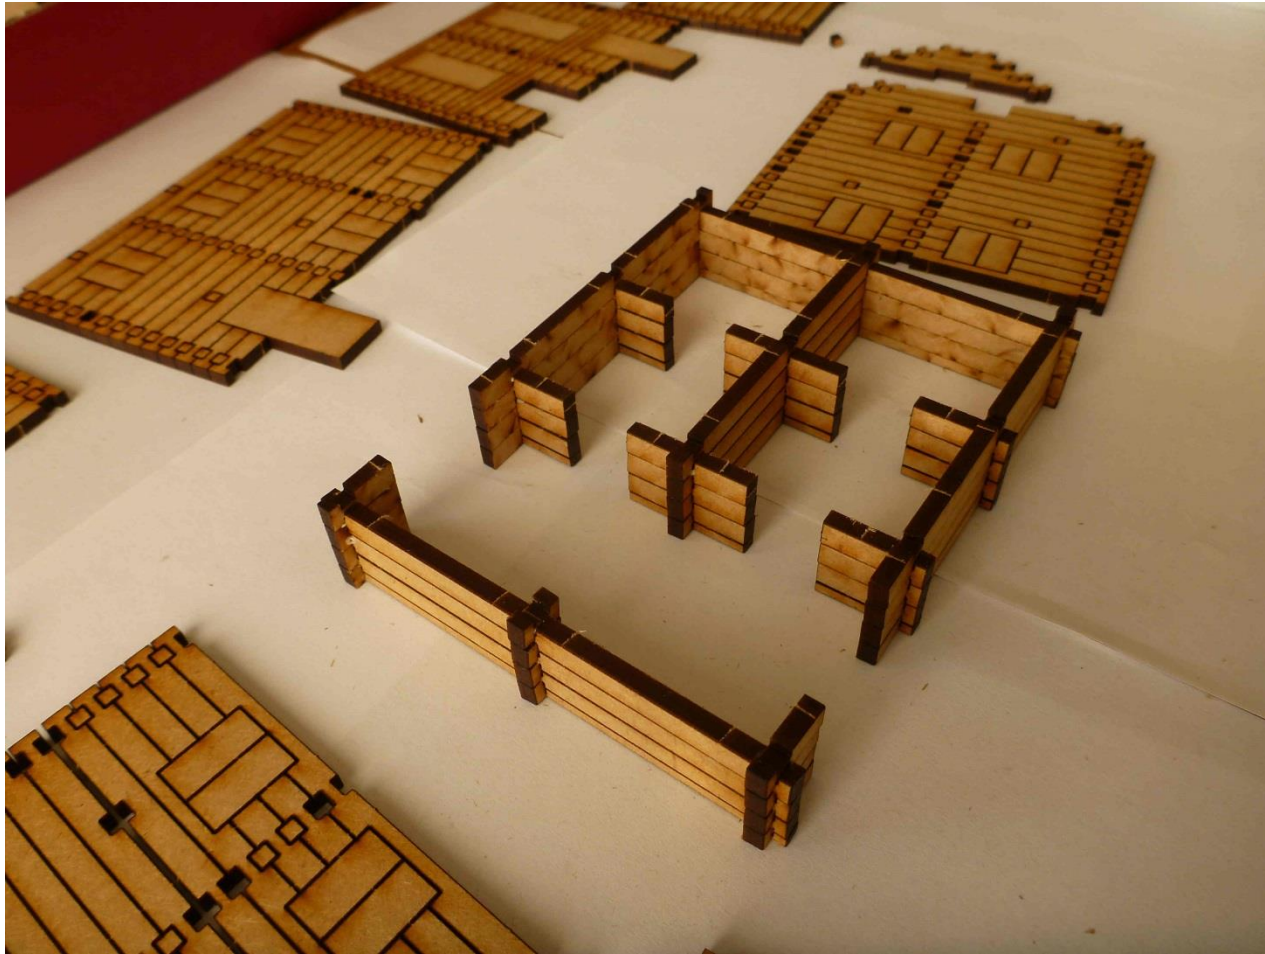

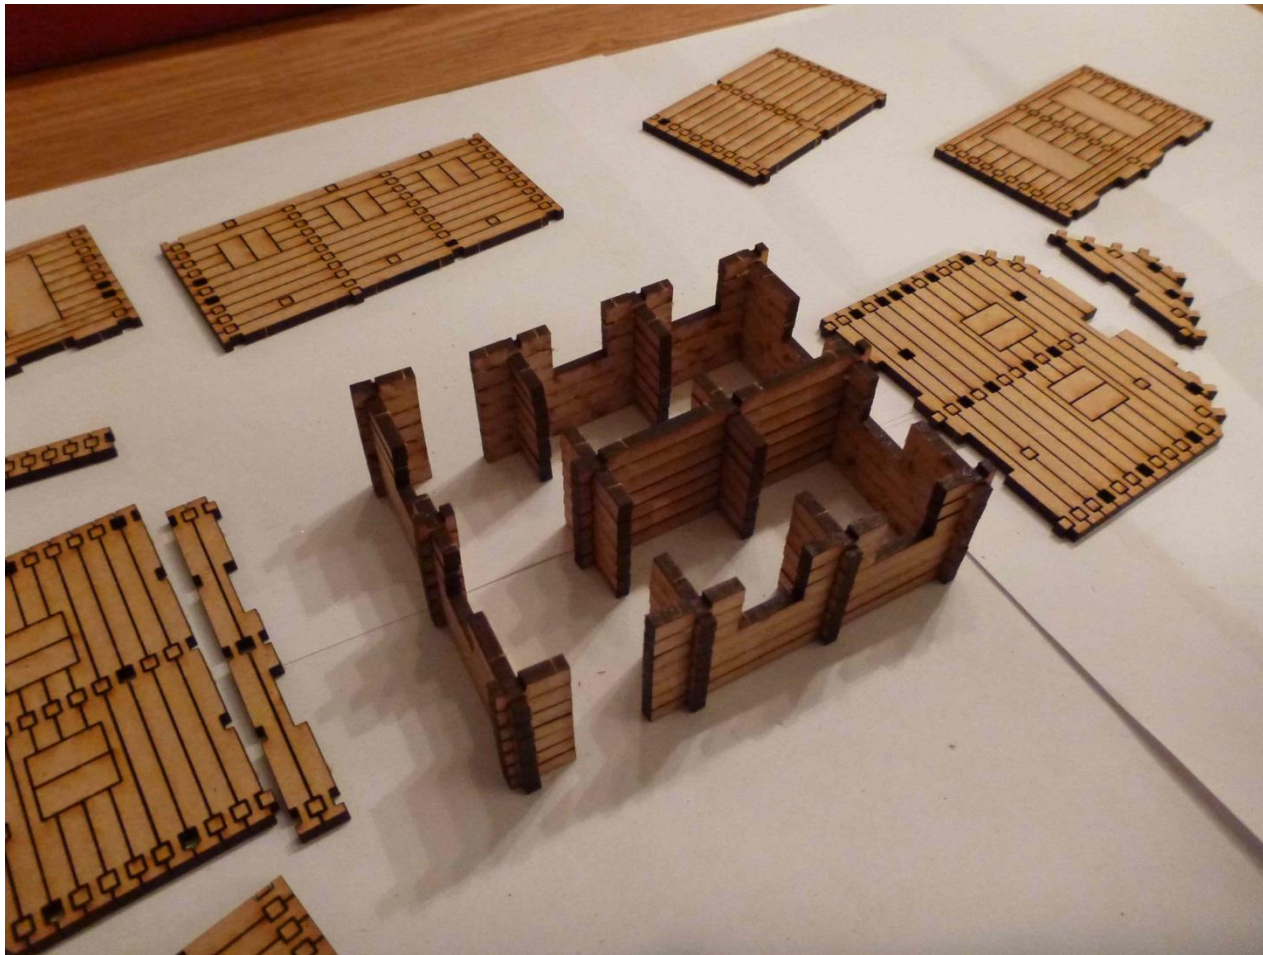

This is a fairly complicated build because of the sheer number of parts. Laying out the walls in an orderly fashion helps a lot.

Continue building upwards as you carefully tear pieces from the bottom of the walls. Mind the short, pesky little pieces around doors and windows. They'll come off if you don't use glue.

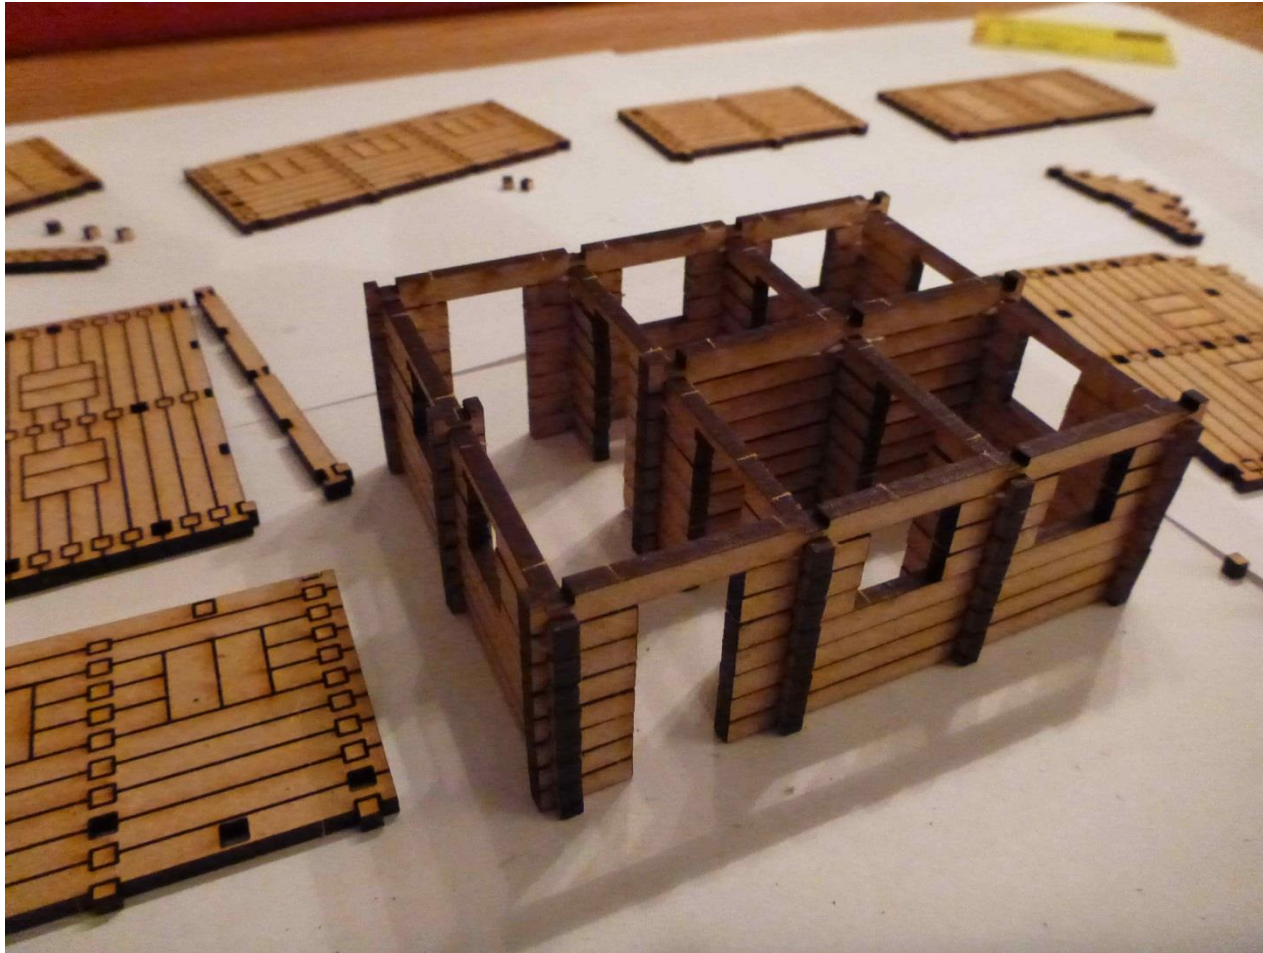

As long as you systematically tear of the bottom pieces of each wall, things should go fine. The building in the pictures is an early prototype. The one I've uploaded is more symmetric, so the pieces are more interchangeable, which should make for an easier build.

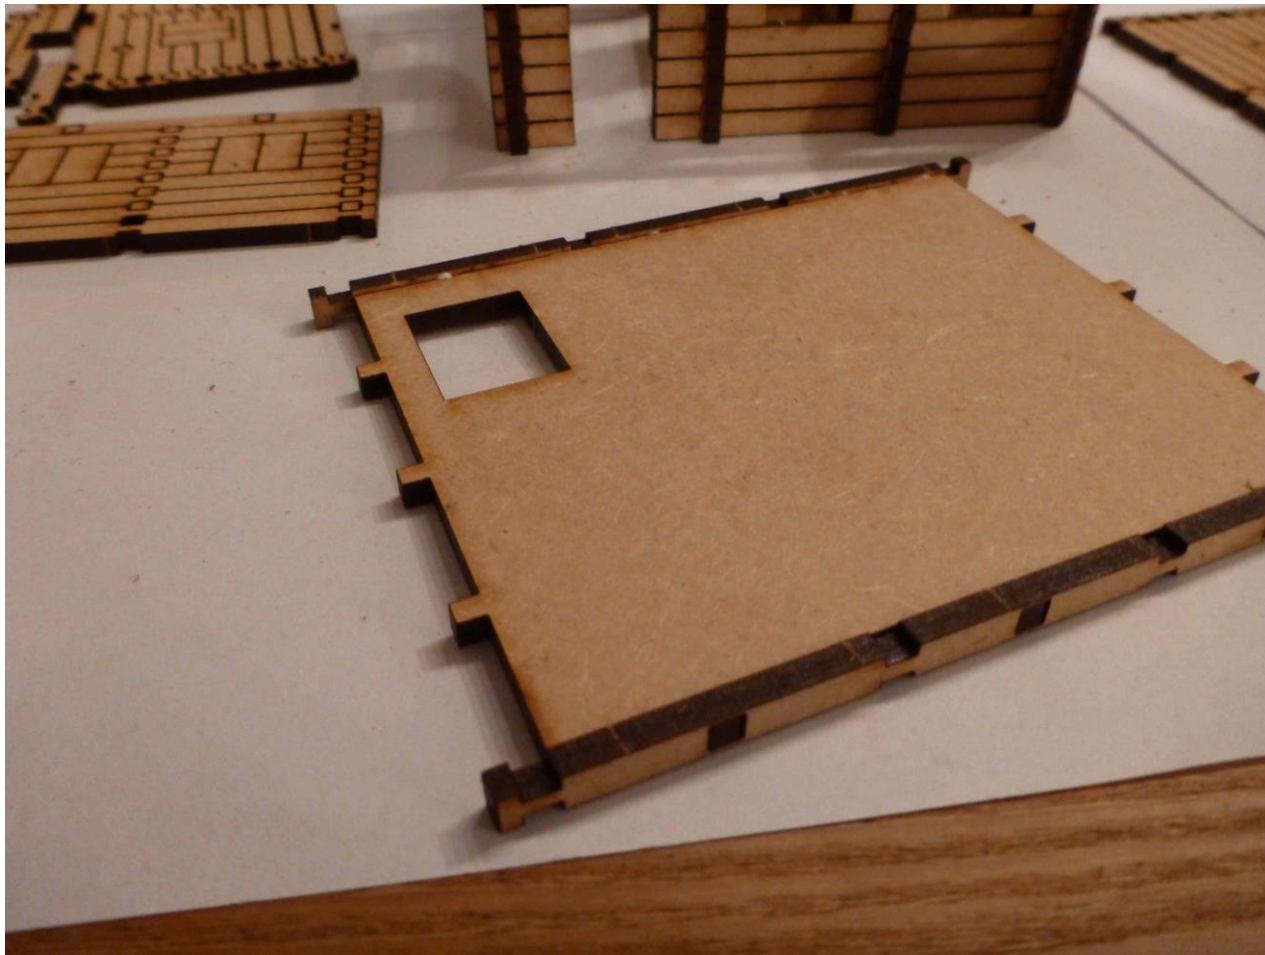

The log that's torn loose to the left of the building is one of the final two pieces on the ground floor. To make the building customizable, don't glue the ceiling to the ground floor. The roof will fit on top of either the ground floor or the first floor, so that the building can have either one or two floors.

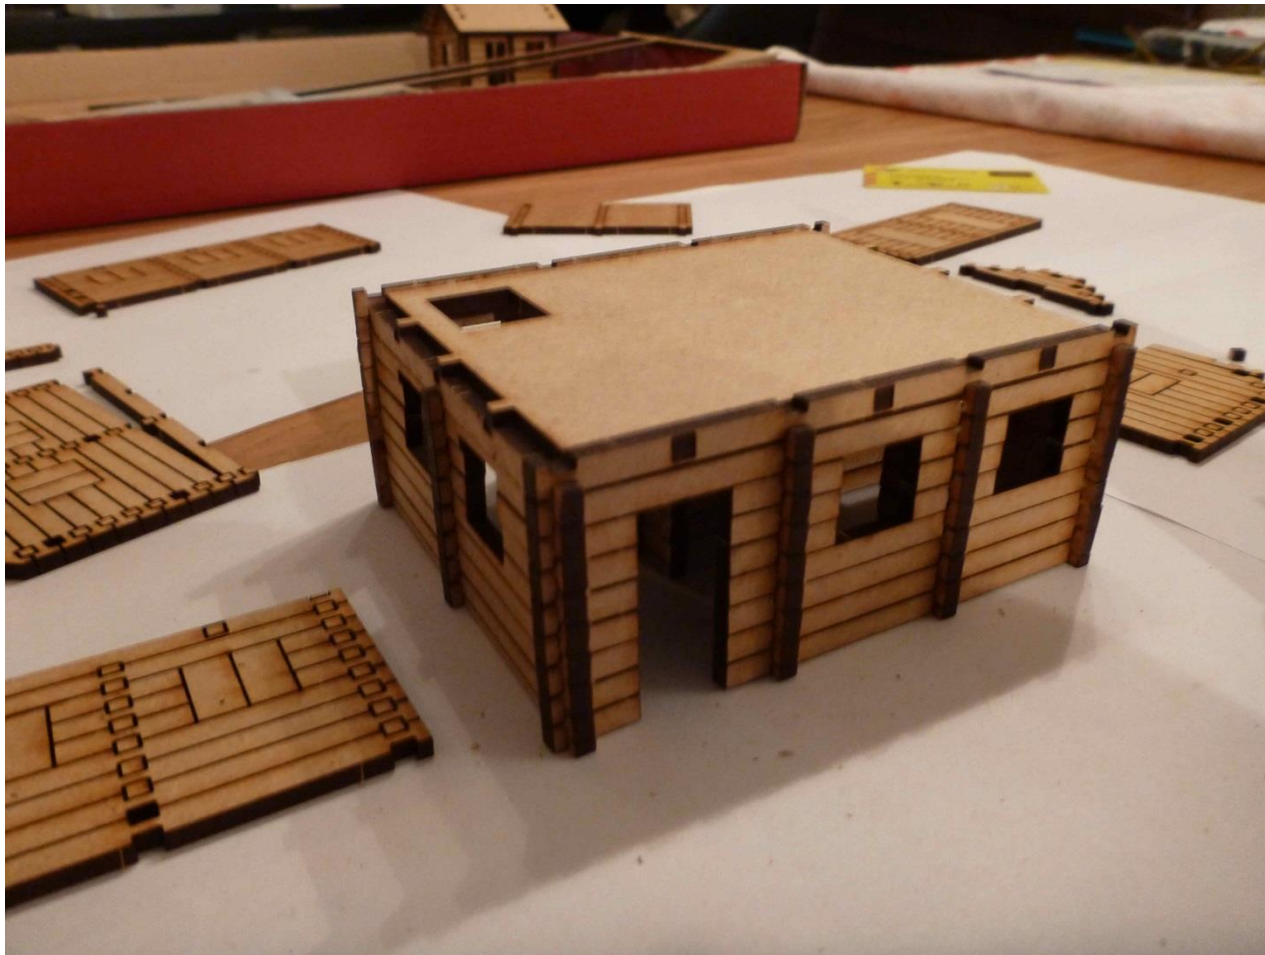

When you get to the ceiling, attach the two logs with holes along the center line to the ceiling piece.

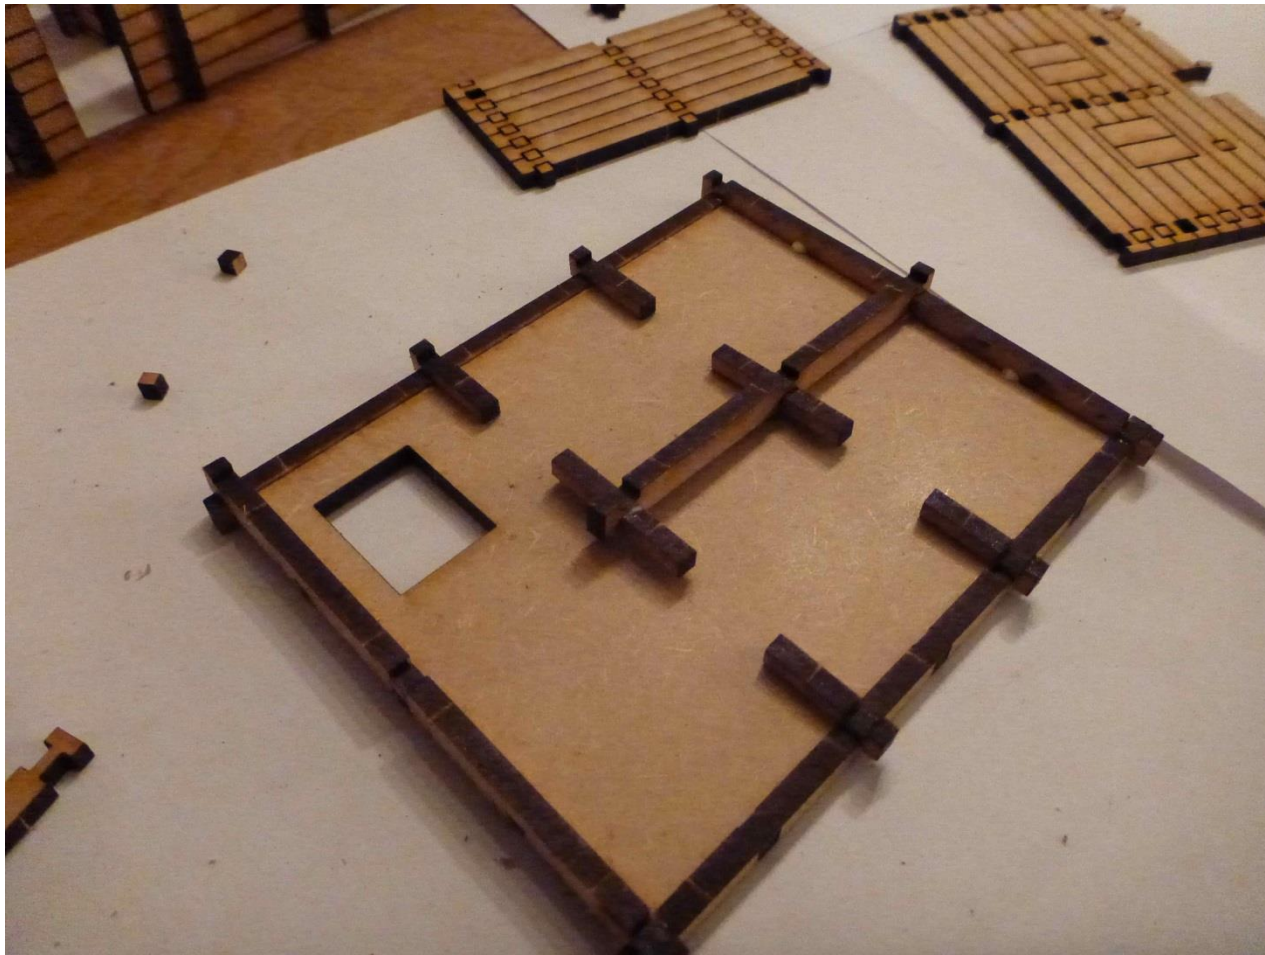

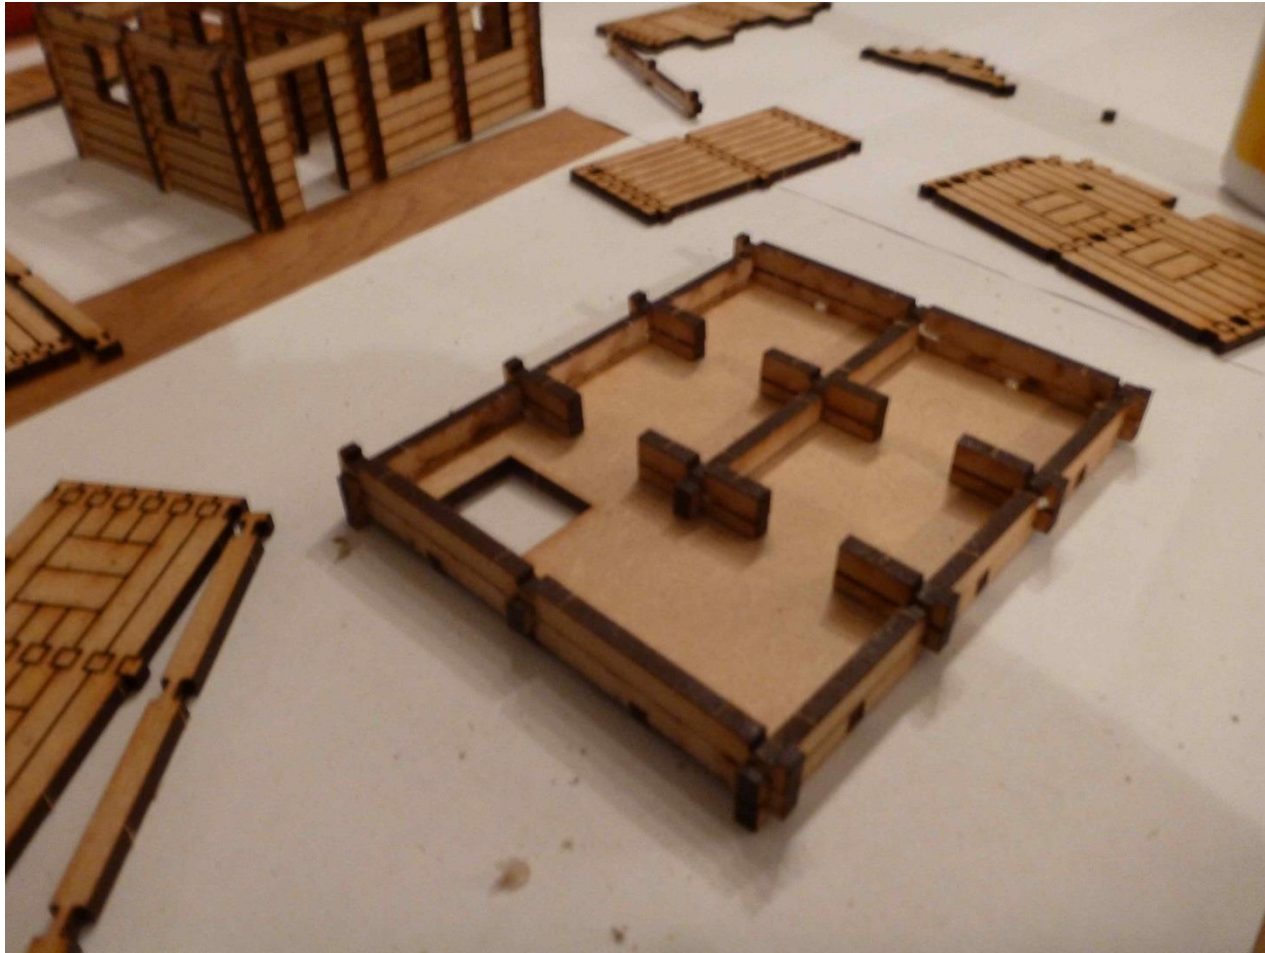

The ceiling should fit on top of the ground floor like this.

Use the ground floor ceiling as the base for the first floor. Start laying down the logs as usual.

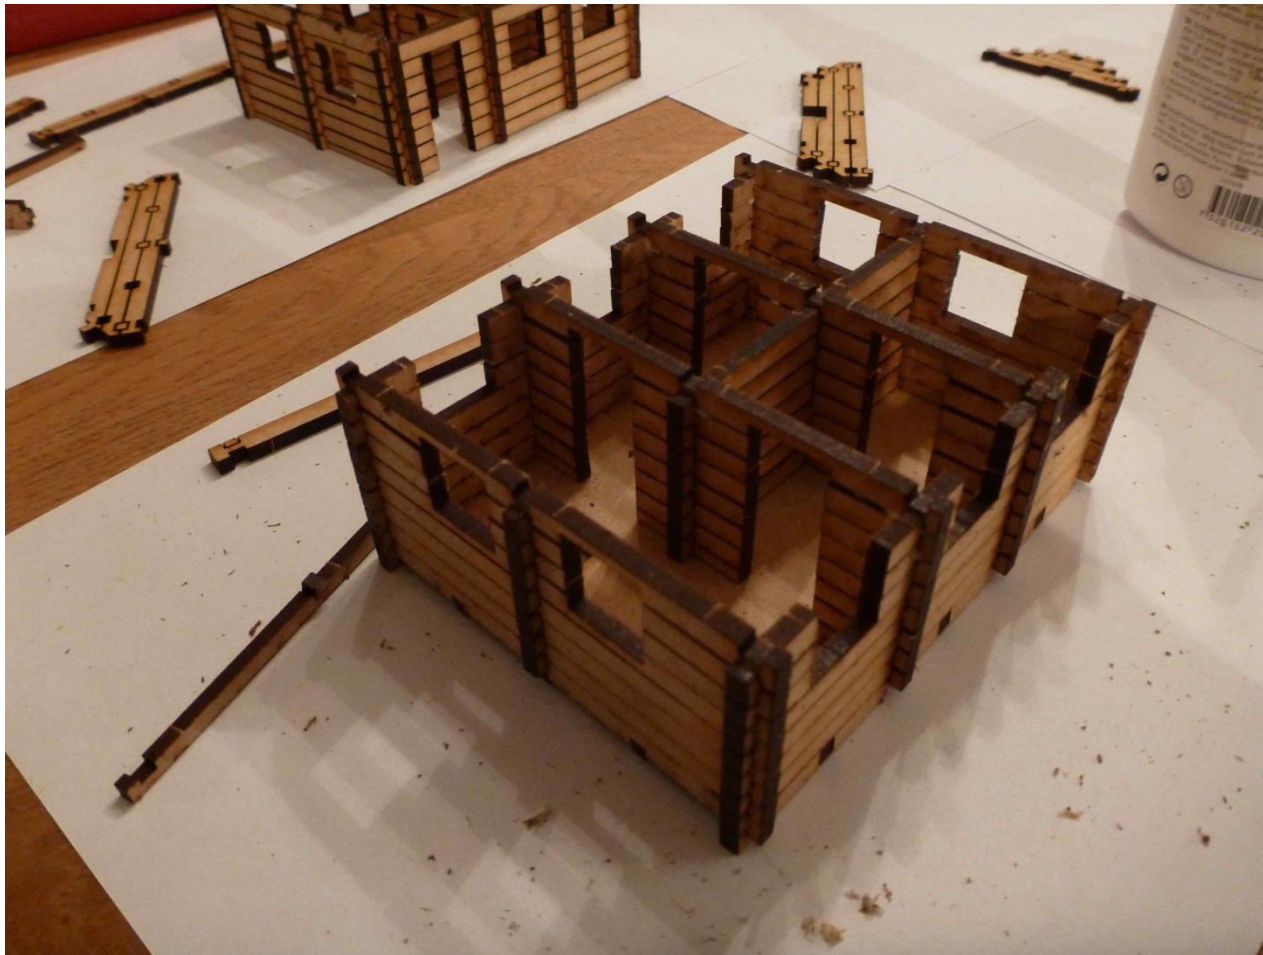

Continue building upwards as you tear pieces from the bottom of the laid out walls.

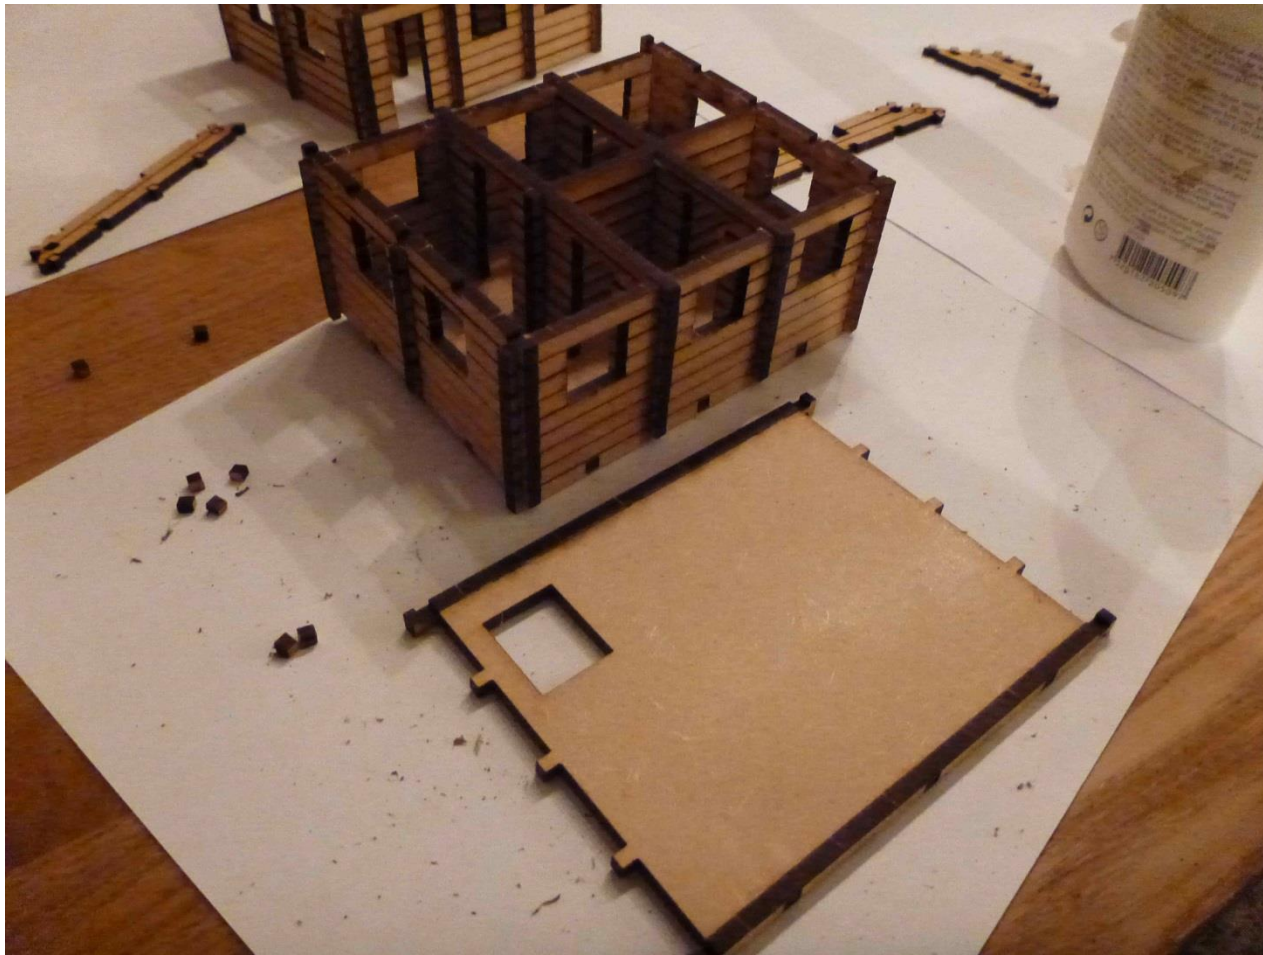

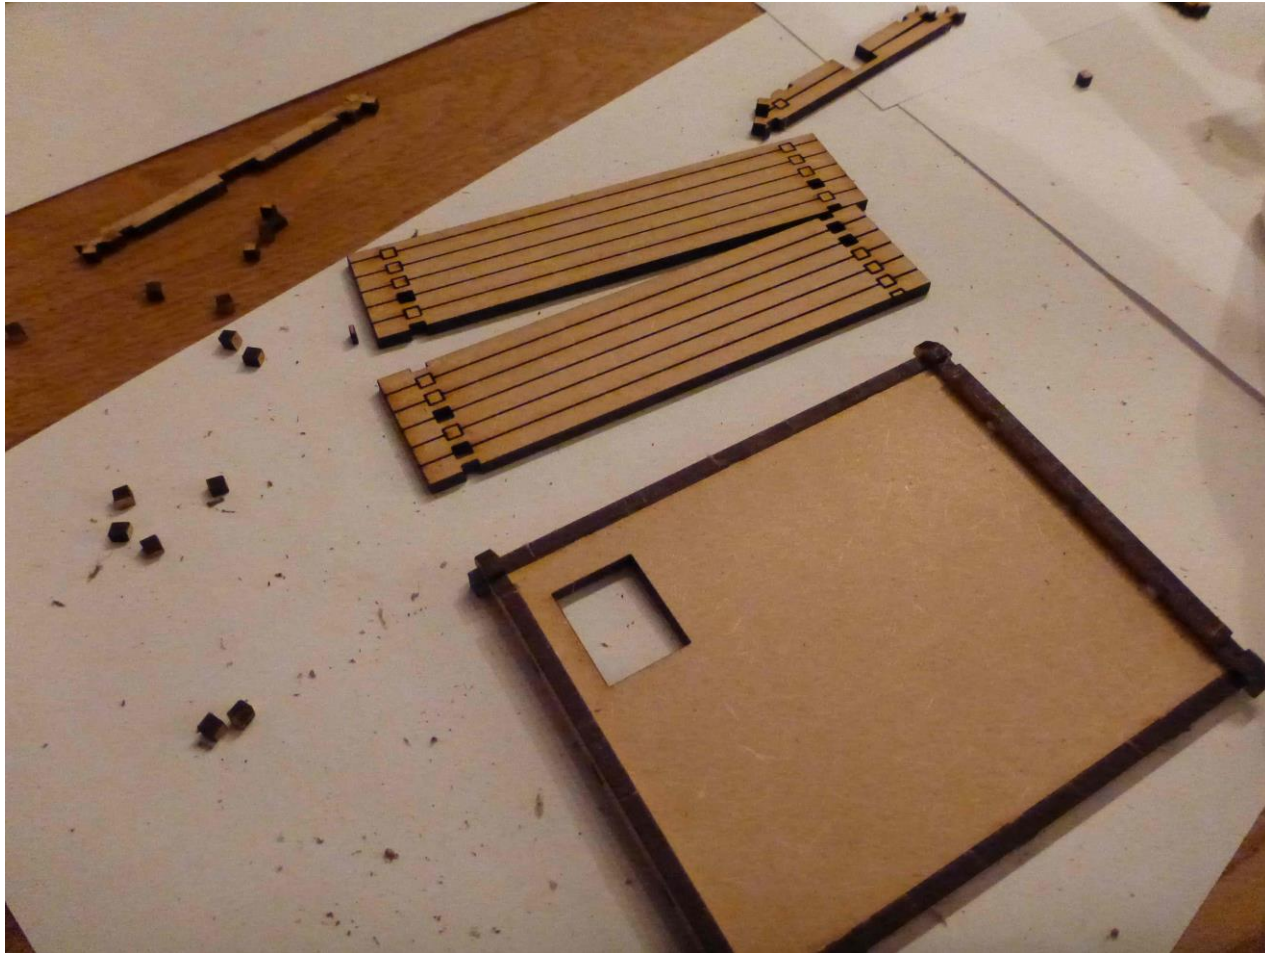

At this stage, we're only a few logs from the roof. I've added a file that'll allow you to make additional floors by following the instructions for this first floor. Log skyscrapers aren't traditional, or possibly even plausible, but tradition is for um... traditionalists...

The roof starts off like the first floor, by attaching the two logs with holes along the centerline to the ceiling.

Start building with the sloping pieces on each end of the roof, and add rafters for each layer. The rafters are important for the integrity of the roof.

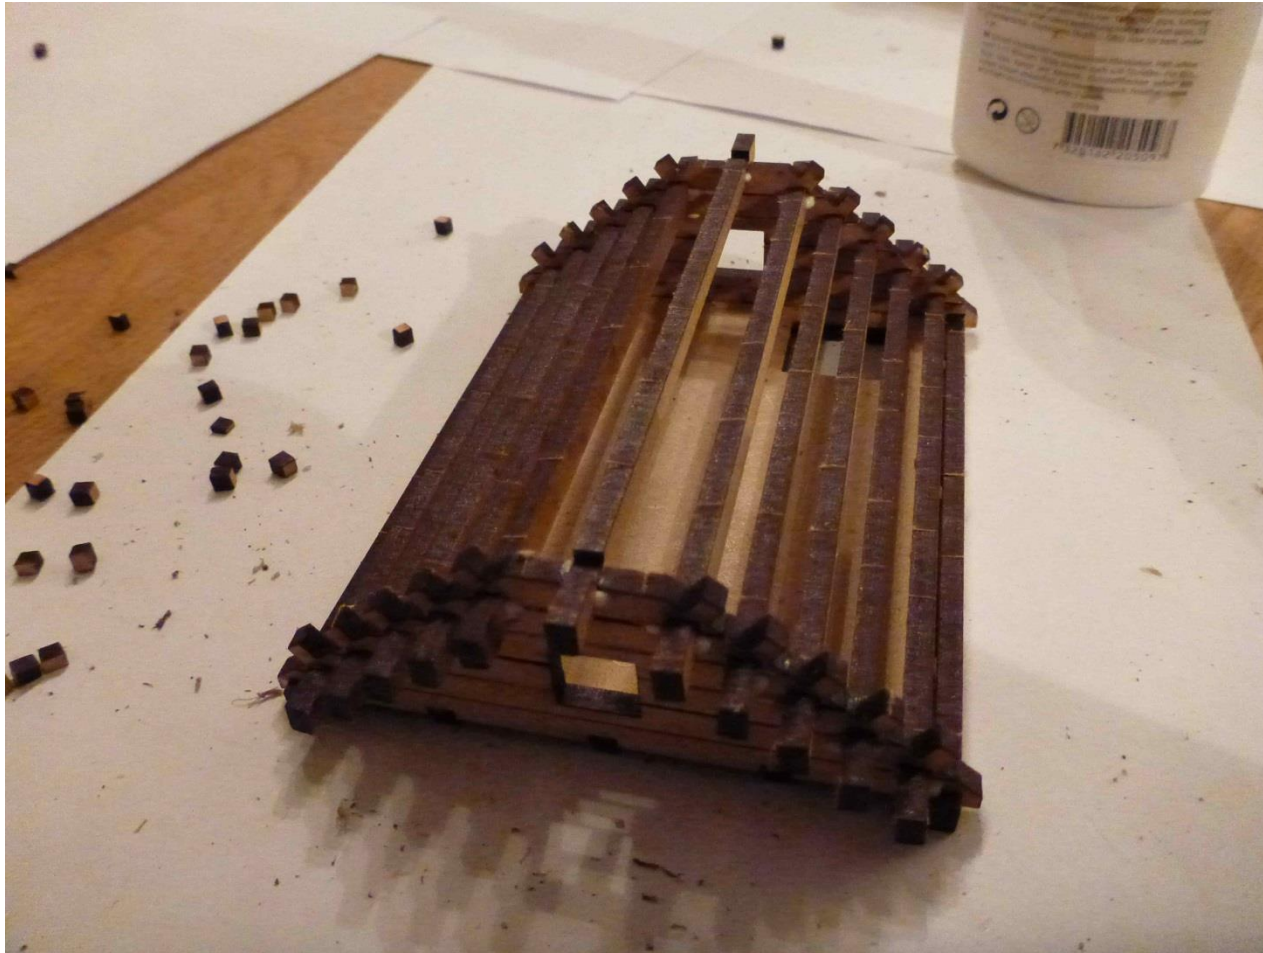

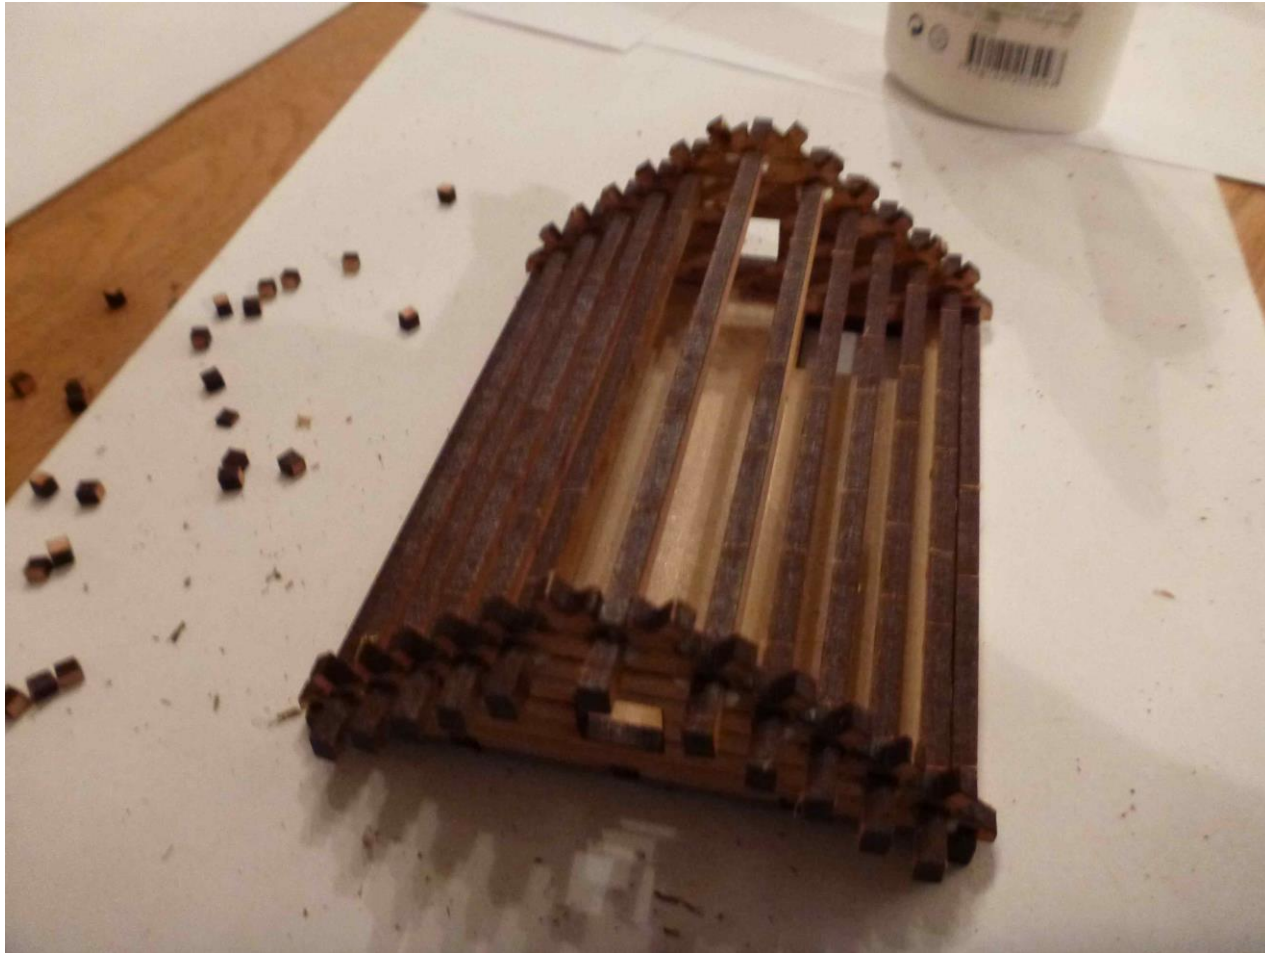

It should look like this as you build.

The top rafter is in two pieces. One part goes between the last and second last sloped piece, the last, thinner part goes at the top.

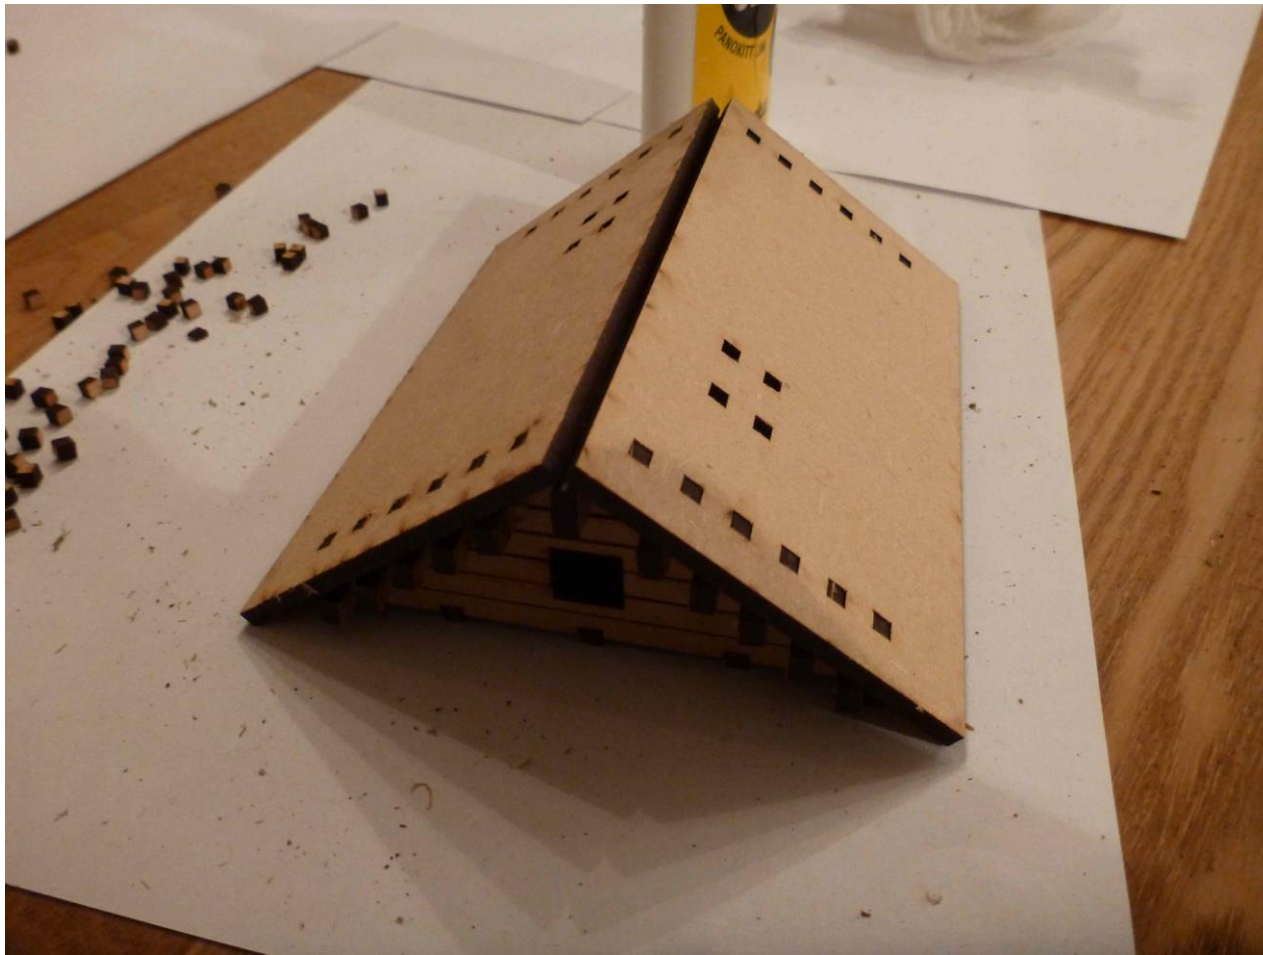

Only the last part of the top rafter missing before the roof itself can be attached...

Carefully press the roof in place. It's a fairly tight fit. I like to turn things upside down, with one side of the roof flat against the table, and press carefully downwards once I get the pegs aligned with the holes.

This is how the near finished building should look. The details around the windows, doors and the chimneys are still missing.

By attaching the roof directly to the ground floor, you get a building with just one floor. Log cabins are inherently modular, aren't they?

«Good evening, good sir! May we take a moment of your time to talk about the Legend of Zelda?»

«Meh. Go bother the peasant in the small log cabin next door.»
